

CHANNEL VISION™

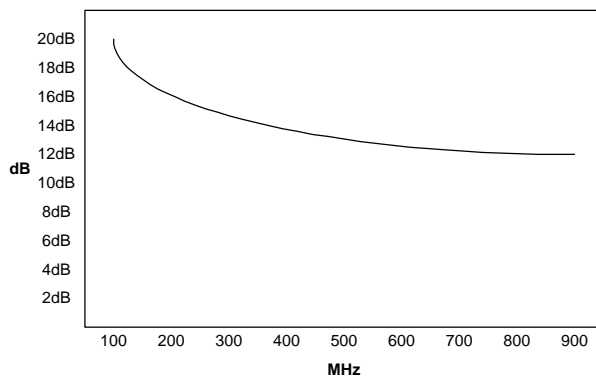

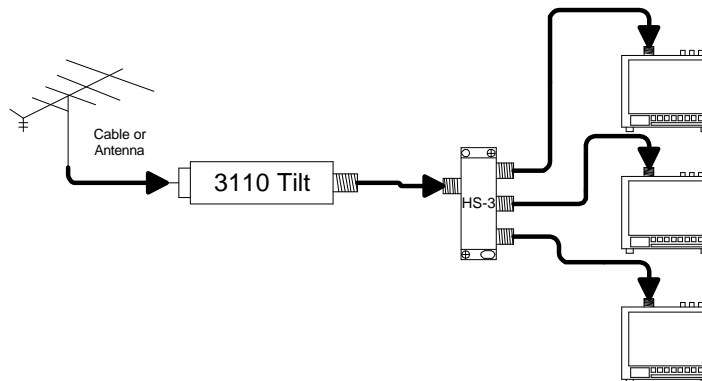

3110 Tilt Compensator

Description:

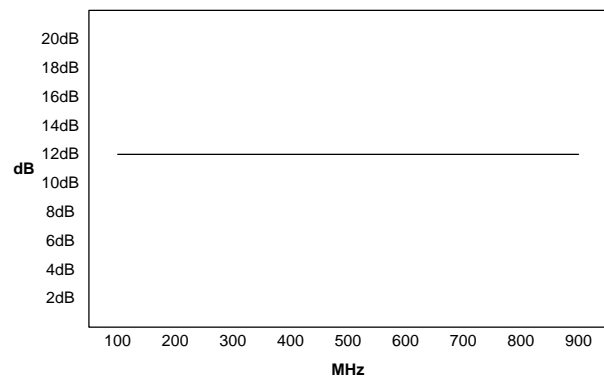

Channel Vison's 3110 Tilt Compensator is used to balance the signal strengths accross all frequencies. In cable systems, Coax Cable will attenuate higher frequencies more than it will lower frequencies (see diagram below), causing an imbalance in frequency strengths as it moves through the spectrum (channel ranges). The 3110 will compensate for this, and provide a true and uniform strength accross frequencies (see diagram below).

Instructions:

Place the 3110 Tilt in line at the head end of the system or on any branch run over 250'.

Before 3110 Tilt Compensator
